

13.1 Ethical Considerations in Gen AI

Some of the ethical considerations in Gen AI are as follows:

13.1.1 Transparency and Accountability

Transparency is critical in Generative AI usage. It is to ensure that AI outputs are traceable and understandable. You must understand how AI makes decisions before accepting its decisions. Also, anyone using AI must know when they are interacting with AI as it helps take account of the limitations and capabilities of these systems and interact accordingly.

Organisations must also establish accountability mechanisms so that when any problems or adverse outcomes arise, they can be dealt with. For any organisation to do so, it must first have the backing of the top management. Then, it must educate the employees on Generative AI's usage, limitations, and capabilities.

Some of the steps that organisations can take to improve transparency and accountability in Generative AI usage are:

1. Documenting AI processes

All organisations must keep a comprehensive record of AI development processes. This documentation should note data sources, training methodologies, and decision-making criteria. This book discussed how Generative AI can be used to build virtual assistants and generate all types of content. Once such documentation is ready, it must be distributed and available to all organisation members.
