

13.1.2 Bias and Fairness

Gen AI models can sometimes unintentionally perpetuate or even amplify biases in their training data. So, if a gen AI model were trained on incomplete or erroneous data, its accuracy would suffer. If modern digital media that gen AI models are trained biased against certain groups, such biases will only amplify when these models are used. Raises ethical concerns about fairness and non-discrimination.

Organisations must strive to eliminate biases from AI outputs to prevent discrimination and ensure fair treatment of all individuals.
