

13.1.4 Human oversight

Using personal data in training-generation AI models requires careful privacy and data management practices. Here are several important steps organisations should take to protect individual privacy and adhere to data protection laws:

1. Human-in-the-loop systems

Incorporating human review points in AI processes will allow supervisors to intervene and correct AI outputs. This will ensure that the outputs meet quality and ethical standards. When humans are involved in decision-making, any anomalies or unexpected results can be quickly identified and addressed.

2. Continuous Monitoring

When you regularly monitor AI outputs to detect issues, you can address them promptly. To continuously monitor AI outputs, it is efficient to set up systems that constantly check the AI's performance and output for any deviations from expected behaviour.

Such a proactive approach will help you maintain the reliability and trustworthiness of AI systems. Depending on the type of monitoring system you set up and the nature of your AI system, it may be possible to make real-time adjustments and improvements to further refine the AI's performance.
