

Prompt Engineering

Welcome to the world of prompt engineering, an essential skill for anyone working with large language models (LLMs) like ChatGPT, Google Gemini, or Claude 3. These AI tools are fresh in the market and full of intelligence and potential, but they need clear direction to produce the desired outcomes.

Because of this, **You must provide structured, detailed prompts that leverage your subject matter expertise.** This chapter will explore the core components of prompt engineering, such as knowledge, prompting techniques, and reasoning. Mastering these elements will empower you to harness the full capabilities of LLMs, transforming them into valuable allies in your digital endeavours.

We will also see how prompt engineering works through a few examples and how you can fine-tune responses.

3.1 AI Tools

When working with one of the large language models (LLMs) like ChatGPT, Google Gemini, or Claude 3, you must treat the LLM as a fresher employee.

This is more so because their capabilities are still somewhat undiscovered. And the more you explore it, the more you will see that they are highly robust and intelligent. They just need to be explored, and it depends upon the user's input on which their output depends.
