

You can share this knowledge with the LLM you are using. In the context of LLMs, knowledge is measured by how much you can write about your domain. Suppose a person is from a manufacturing background and wants to improve the process. In that case, you should be able to give LLMs input about processes rather than just asking the LLM to help improve the manufacturing processes. You should be able to write things like

“Currently, we are facing a bottleneck in transporting goods from one department to another while manufacturing. The issue is also that a lack of cleanliness and wastage in transferring work-in-progress goods from one machine to another affects the turnaround time for actually getting the materials, putting in the machines, and getting an output.”

When you say this to the LLM, it gives the knowledge that is very specific to your needs and domains.
