

3.2.3 Improved reasoning ability

Finally, you also require improved reasoning ability. You need to know how to reason with LLMs. Once you get a response from the LLM, you should also be able to tune these responses because sometimes you may not get the desired response in the first prompt. You will require two to three iterations to get the desired response. So, you must learn how to fine-tune your inputs to get your desired response.

You must know how to give further instructions when you do not get the desired response. You should note the necessary changes and instruct the bot to make them.

Knowledge, prompting and improved reasoning ability are the pillars of prompt engineering. Whoever does these three things can get the desired output from any AI tool.
