

3.3.1 Zero-shot prompt

In zero-shot prompting, you give no examples and rely entirely on the bot's knowledge to generate the output. Take an example of writing a social media post for launching a new organic lipstick product line. So, simply put a prompt saying:

“Can you give me a social media post for a new line of organic lipsticks?”

In this method, you won't receive any input about what the lipstick is about, the shades it is available in, or its ingredients. Instead, you can rely on the LLM's experience and knowledge to get the answer. With this method, you will get a very poor response.

3.3.2 Contextual prompt

In contextual prompting, you give more context to the AI chatbot. Expanding on the previous example, submit a prompt saying:

“Can you now give me a social media post for organic lipstick? But in this scenario, my organic lipstick is made from natural ingredients, has over 20 shades, is available in almost every leading store and online marketplace right now, and my target audience is 25- to 35-year-old females from urban cities?”

Suppose you need a blog post promoting a software product targeting small businesses, highlighting its unique features and benefits. In that case, you will share all the distinctive features of the software, how it can be bought, and how it can be used, among other things.

So, in this method, we are giving more and more context and knowledge so that the bot can give you the desired response.
