

Here, the green highlight means that a high-probability word was chosen, and as the colour gets closer to yellow, it means that lower-probability words were chosen. By hovering over the words, we can see which other words were considered and the probability of them being used.

ChatGPT calculates the probability of a word following the previous one

So, ChatGPT calculates the mathematical probability of a word coming after the previous word is written. This is what ChatGPT keeps on doing for each word in its response.

Context matters not just probability

ChatGPT sometimes chooses a lower-probability word, like “advers,” when it fits the context better
