

PAWS and UAWS also differ in the amount of time they actually allocate to planning their investments.

Planning is typically found to be a strong habit among people who have a demonstrated propensity to accumulate wealth. *Planning and wealth accumulation are significant correlates even among investors with modest incomes.* In our survey of 854 middle-income respondents (see [Table 3-5](#)), for example, a strong positive correlation was found between investment planning and wealth accumulation.

One of the more interesting findings in our studies of the affluent relates to why many people spend so little time planning their investments. Many people who do little or no investment planning often feel the way these respondents did:

It's hopeless....

I never have the time needed to make it pay off.

We never have made so much.... But the more we earn, the less we seem to accumulate.

Our careers take up all our time.

I don't have twenty hours a week to fool with investing my money.

But PAWs do not spend anywhere near twenty hours a week in this way. If you study [Table 3-5](#), you will notice that, on average, even prodigious accumulators of wealth do not need to devote a large proportion of their time to planning their investment strategies.
