¹Small population ancestry groups are those with fewer than 100,000 households residing in the U.S., according to the 1990 Census of Ancestry of the Population of the United States.

²For example, households with Israeli ancestry have 2.6351 times greater the proportion of high-income (\$100,000 and over) households than the proportion for all U.S. households.

³For example, households with Israeli ancestry have 0.3870 times the proportion of publicly assisted households than the proportion for all U.S. households.

⁴For example, the ancestry economic productivity index for households of Israeli ancestry (6.8095) is determined by taking their high-income index (2.6351) and dividing it by their dependency index (0.3870).

This is not to suggest that self-employment and/or being first-generation American ensures membership among the ranks of millionaires. Most self-employed Americans will never accumulate even modest levels of wealth. The same is true for most first-generation Americans. But twenty-three million people in this country today were born elsewhere. That is a large gene pool. Note also that 12 percent of *INC.* magazine's top five hundred business entrepreneurs are first-generation American.

One might expect that the sons, daughters, grandsons, and granddaughters of these people would automatically become even more successful economically than they. Not really. We will discuss intergenerational transfers in more detail in Chapters 5 and 6, but allow
