

After each criterion is ranked 1 through 10, grade each choice 1 through 10 for each decision factor. The school system in Detroit? You give it a 4. In Phoenix, you give the school system a 5, as you determine it is slightly better. You assign entertainment in Detroit an 8 as they are home to your mighty Red Wings, while Phoenix gets a 6. Continue for each decision factor within each choice. Your WADM should now look something like this:

Weighted Average Decision Matrix (WADM)		
Factors	Detroit	Phoenix
Weather (10)	2	8
Schools (3)	2	3
Cost of Living (6)	5	7
Business Climate (2)	6	4
Taxes (7)	6	7
Safety (4)	3	6
Entertainment (8)	5	2
Near Family (7)	10	0

Next, for each row, multiply the weight times the grade and put that number next to the grade in parentheses. For example, in the entertainment row, Detroit receives a 40 (8 weight $\times$ 5 grade), while Phoenix receives a 16 (8 weight $\times$ 2 grade). Do this for all rows. Your WADM should now look like this:
