The late Peter Roebuck, one of the world's greatest cricket writers, wrote, 'Dravid has a simple game founded upon straight lines. Reasoning that runs cannot be scored in the pavilion, he sets out to protect his wicket. Curiously, this thought does not seem to occur to many batsmen, a point many a long-suffering coach could confirm.' Michael Lewis's celebrated book, *Moneyball: The Art of Winning an Unfair Game*, which went on to become a movie starring Brad Pitt, highlights the Rahul Dravids of Major League Baseball in US.

When it comes to stock markets, intuition suggests that shorter investment horizons are akin to speculative investing, where investors do not need to focus too much on the quality of the company to generate good returns. Over longer investment horizons, one would intuitively imagine, investors would need to rely on high-quality companies for superior returns. However, the chart below shows that whilst the quality premium exists across all holding periods for the CCP, *the quantum of the quality premium is higher for shorter holding periods* (three years and five years) compared to longer holding periods (seven years and ten years). Hence, the extent of outperformance that an investor can generate by upgrading the quality of his/her portfolio is greater for shorter holding periods (compared to longer holding periods).
