

Brent Crude Oil

General Characteristics

Brent crude oil is a light sweet crude oil from North Sea.

It has API (American Petroleum Institute) gravity between 38-39 and has higher sulphur content than the other well-known benchmark, WTI crude oil.

Brent crude oil is a global benchmark for other grades and is widely used to determine crude oil prices in Europe and in other parts of the world.

Brent is typically refined in Northwest Europe, but a major portion is been exported to the US Gulf and East Coasts, and also to parts of Mediterranean.

It is more expensive than the Organization of Petroleum Exporting Countries (OPEC) basket, but lesser than West Texas Intermediate (WTI) because of higher sulphur content than the WTI crude.
