

To give you a quick idea of what this looks like in action (also illustrated in [figure 13.2](#), overleaf):

- Investing \$1000 once, with an average return of 7 per cent, could grow to around \$3869 over 20 years, even if you never add another cent.

The numbers can be even more powerful when you add small, regular contributions over time. Let's imagine you start with \$1000 and then add:

- \$10 per week for 20 years at 7 per cent net (after tax and fees) could grow to around \$22 700.
- \$50 per week for 20 years at the same rate could grow to around \$113 500.
- \$100 per week for 20 years could grow to over \$227 000.
