

Like gold and silver, platinum is traded around the clock on the global commodities markets. It tends to fetch a higher price than gold during routine periods of market and political stability, simply because it is much rarer; much less of the metal is mined annually. Other factors that determine platinum's price include:

1. Like silver, platinum is considered an industrial metal. The greatest demand for platinum comes from the automotive catalyst industry, where it is used to reduce the harmfulness of emissions. After this, jewellery accounts for the majority of demand.
2. Because of the automobile industry's heavy reliance on the metal, platinum prices are determined in large part by automobile sales and production numbers. "Clean air" legislation could require auto makers to install more catalytic converters, increasing demand, but in 2009, American and Japanese car makers were turning to recycled automobile catalysts, or using more of platinum's reliable (and usually less expensive) sister group metal, palladium.

While gold ETFs are easily available for online trading in India, silver and other precious metals are still not traded online.

Financial Investment Tools	
Bank Fixed Deposits (FDs)	Superannuation
Bank Recurring Deposits (RDs)	Gold
