

- This is the final size of the nest egg to set you financially free, and this will be picked up automatically from the results of the first worksheet (Nest Egg Calculator)

3. Independence Start Year

- This will be picked up automatically from the results of the first worksheet (Nest Egg Calculator)
- Understand here that the intent of the second worksheet is to calculate the duration needed to achieve the target corpus. Therefore Independence Start Year should be the result of the second worksheet rather than an input. However, if you check carefully, we assumed an Independence Start Year in the first worksheet. This assumption gets validated and tuned with the help of data in the second worksheet.

4. Monthly savings today (Pre-freedom)

- This is the amount of monthly savings that you can manage today
- This amount boosts your nest egg
- This is nothing else but your saving potential (from Step 1)

5. Savings increment per year

- Estimate the approximate percentage increase in your income every year, due to salary increments, promotions, increased business revenue, etc.
- This increase in income contributes directly to your monthly savings

6. Return on investments (pre-freedom)

- This is the expected percentage return on investments made from your current nest egg
- This is the 'pre-freedom' RoI/your current RoI that is the same as the one calculated in Step 2 / Assets Sheet.

Figure 7.7 shows you a snapshot of the inputs needed to the Worksheet "Duration Calculator".
