

at one point in every speech he would abandon his plan, pause very briefly and close his eyes. What followed when he opened his eyes would be the climax of his speech, so stirring that he often brought an entire audience to its feet. In that pause of two or three seconds I believe he focused all of his sexual magnetism and his creative imagination into a great receptive force which never failed him. In his own words: "I do it because then I speak through ideas which come to me from within."

The late Dr. Elmer Gates was one of the world's greatest scientists, although he never publicized himself. He patented more than two hundred inventions, many of which were created through a very significant method.

He had what he called his "personal communications room." It was lightproof and soundproof, equipped only with a small table, a chair, a pad of writing paper and some pencils. When Dr. Gates desired to focus his forces, he would shut himself into this room, sit at the table, and concentrate upon the *known* factors of the invention upon which he was working. Soon ideas would begin to flash into his mind concerning the *unknown* factors of the invention.

On one occasion he wrote rapidly for three hours, hardly aware of what he was writing. When at last he examined his notes, he found they contained principles which had been discovered nowhere else in the scientific world. These principles solved the problem—and broke ground for other men to follow.

Dr. Gates earned large fees merely by "sitting for ideas." Imagine a large corporation paying an outsider merely to sit in his room and think!

We cannot tell exactly where experience leaves off and intuition begins. It has been said that genius consists of the ability to see the patterns of things and project those patterns. The quiet focusing of inward forces surely is a great aid in summoning odds and ends of knowledge through the subconscious mind and forming them into patterns never seen before. Yet beyond this lies the Unseen which gives life to it all. And can this somehow be a function of sex? Why not—when all the world is male and female, and even the basic building blocks of the universe are oppositely charged particles which constantly interact.

In essence, sex transmutation is the ability to switch a desire for physical contact to a similar desire for expression—in art, literature, science, selling or anything else. The switch
