

bined with heat, and our eyes perceive this. The lowest light-vibrations begin with deep red, the highest are violet, with all other colors in between. Above the vibrations of violet—some 3,000,000 per second—lie ultraviolet and other vibrations invisible to the eye but detectable by instruments.

Still higher up the scale—we cannot yet say how high—may lie the vibrations of *thought*, and these are the invisible, inaudible vibrations which flash from mind to mind.

Dr. Alexander Graham Bell, whose name we justly associate with the telephone, was an authority on vibration. He noted that we have no ordinary sense that can appreciate the effect of any vibration between heat and light. He said: “. . . there must be a great deal to be learned about the effect of those vibrations in the great gap where the ordinary human senses are unable to hear, see or feel the movement. The power to send wireless messages by *ether* vibrations lies in that gap, but the gap is so great that it seems there must be much more. . . . It seems to me that in this gap lie the vibrations which we have assumed to be given off by our brains and nerve cells when we think. But then, again, they may be higher up, in the scale beyond the vibrations that produce the ultraviolet rays [my own theory].

“It would be possible to cite many reasons why thought and vital force may be regarded as of the same nature as electricity. . . . We may assume that the brain cells act as a battery and that the current produced flows along the nerves. But does it end there? Does it not pass out of the body in waves which flow around the world unperceived by our senses, just as the wireless waves passed unperceived before Hertz and others discovered their existence?”

Field theory and thought-transference. Einstein showed mathematically that vast fields of force pervade the universe. A field of force comes out of every wire that carries current—or we would have no electric motors, no radio or television and would lack quite a few other conveniences. Why should not a field of force emanate from the electricity which constantly passes to and fro along the conducting nerves and cells of the body? Why should they not go around the world, into space, on forever?

Now our world is both threatened and uplifted by the physical realization of Einstein's great mind-concept of nearly sixty years ago: $E=mc^2$. This formula governs the conversion of mass into energy, and accounts for the enormous energy
