

conscious mind and told it what I expected of it. He received added stimulation of his nervous system through chiropractic adjustment.

With this method I induced nature to build an extra set of auditory nerves from Blair's brain to the inner walls of his skull. Now, he did not grow ears, but he achieved ability to hear equivalent to about 65 per cent of the normal level, and with that he got along quite well. Some may call this a miracle of healing, but I would rather call it a demonstration of the power of natural forces.

Just how does Blair hear? Through bone conduction to those new nerves inside his skull. Now we know that some of the marvelous new transistorized hearing aids depend on bone conduction.

Can the method be extended? My method worked, but it required that some devoted person remain on duty many hours a night. Later I experimented with a phonograph which repeated a recorded message every fifteen minutes, piping it to a hearing device beneath the sleeping person's pillow. I myself have received great benefit from this device.

We know, too, that corresponding devices are sometimes offered for sale. These devices have been benefited by modern developments in sound recording and transmission, but their principle is the same. Concurrently I have become aware of other recent research into the techniques of sleep-learning which suggests some of the difficulties people may encounter:

First of all, the machine alone is not enough. First there must be *belief* that the subconscious mind can and will receive messages while the conscious is asleep. A skeptical mind may make nothing of the messages. A mind filled with fear and inferiority, or both, will soon decide the "gadget" is too much trouble to use.

Then too, some people have their sleep so disturbed by the mere existence of a machine at their bedside that their conscious minds never really go out of action. Probably they could condition themselves to sleeping, machine or no machine, but I suspect that most such people are more anxious to return the machine within the time limit of its guarantee!

Many people also seem to go to lengths to negate any benefit they may obtain through sleep-learning. The subconsciously recorded message needs time in which to take root, so to speak, in the myriad cells of the mind. It will not do this if the conscious mind is allowed, even encouraged, to use
