

gence. What was it, then, which impelled their minds to seize upon great goals, then winnow all the circumstances of life and make use of what could help them achieve their ambitions? It was *success consciousness*.

First you must know your own mind; then you find success consciousness. When Henry Ford mastered the art of making a good, inexpensive automobile, he still went on using his success consciousness. He had to make sure his cars were well distributed and their sale pushed in every part of the country. For this he needed capital. The bankers had capital to lend, but he did not want outside financial interests to take hold of his company.

Ford's truly efficient mind showed him the way to get the capital he needed even while he built up his distributing organization. First, he allotted his entire output of automobiles only to distributors who held the Ford franchise. Then he made it clear that each distributor must accept a fixed quota of cars, advancing in cash a percentage of the purchase price before the cars were delivered.

This plan made every distributor practically a partner in the Ford business, yet it did not affect Mr. Ford's control of the business. Again, without affecting his control, it provided him with the necessary operating capital. Moreover, it provided his dealers with a very definite incentive toward finding a buyer for every car—actually the same incentive they would have had if they had been operating their own independent businesses.

I have heard it said that this plan worked a hardship on some of the Ford distributors. Having known some dealers since before the Model T car, however, and having looked at today's record, I can say that most Ford dealers are noteworthy for their success.

Two bicycle mechanics, Orville and Wilbur Wright, gave the world its first successful airplane. What kept their minds clicking, caused them first to build the world's first wind tunnel, caused them to find a secret of wingtip control which nobody else had thought of? What caused them to surmount limitations of material and of power which still make that first flight look "impossible"? First they took control of their own minds and their own lives; then they were guided by the success consciousness which always follows.

Is today's world different? Only in some details. Take such a device as a memory core, a tiny magnetic gadget which operates by the thousands in many modern computers. The
