

horizon that one is unlikely to outlive, and to then ensure that one's plan can work for this long. Those with greater longevity risk aversion, which is the fear of outliving their resources, will seek a higher planning age with a lower probability to outlive. Individuals pick planning ages that are sufficiently conservative to reflect their personalized concerns about outliving their wealth. Choosing planning ages based on only a 10 percent chance for outliving may be a reasonable baseline assumption. I have described the basic framework for making the decision.
