Note: SAFEMAXs are boxed. All MWRs below 4 percent are bold-faced.

It is important to emphasize that this 1 percent underperformance should not necessarily be viewed as fund management or advisory fees. Doing that would confuse the reality that most investors, on their own, would not be in a position to earn the underlying benchmark index returns. Evidence on investor behavior suggests that investor returns trail behind overall market performance even net of investment costs.

Market Mistiming

Generally, investors tend to increase stock allocations near a market peak and then panic and decrease allocations after a market drop. Vanguard has estimated that the behavioral coaching provided by financial advisors to help their retirees stick with a financial plan could add 1.5 percent of additional returns for an investor per year on average over time (their study is discussed further in chapter 9). Even after advisory fees, the net return earned by the investor could be higher than otherwise. In this regard,
