

initial \$4 level. This happened by year twenty-one of retirement, at an assumed age of eighty-six, as withdrawal percentages increased at a fast enough pace to counteract declining wealth.

Exhibit 6.17

Time Path of Real Spending and Wealth

Performance for All Strategies, 1966 Retiree

For 4% Initial Spending Rate, 50/50 Asset Allocation, Rolling 30-Year Retirements

Using SBBi Data, 1966–1995, S&P 500 and Intermediate-Term Government Bonds

Next, Exhibit 6.18 provides the results for the 1982 retiree, which experienced the highest sustainable withdrawal rate in the historical period
