

## **Retirement Income Strategies**

This discussion of the two schools of thought highlights that retirement income planning is a field in flux. Exhibit 1.5 illustrates this matter with just a sampling of different retirement income planning techniques used in practice today. The exhibit includes thirty-six possibilities, which I have attempted to differentiate in part by whether they have characteristics more similar to the probability-based or safety-first philosophy.

Many more strategies could be listed in the “Total Returns/Variable Spending” category, as it seems almost every financial services company is developing a retirement income strategy these days. Most of the excluded strategies would be difficult to distinguish from what is already on the list, though.
