

I do not mean the Federal Government alone. The various states—and even counties and cities —license, tax, inspect and regulate businesses within their jurisdictions. It should hardly be necessary to mention that it is but a short step from such economic regulation as exists at the present time to the establishment of a completely regulated economy. And—be it for better or for worse—all recognizable signs augur more, rather than less, economic regulation for the future.

With government setting the example, it is little wonder that many of the nation's citizens anticipate the seemingly inevitable and hasten to conform to standardized patterns.

Business firms that establish their own bureaucracies and individuals who strive to be conformists are merely floating with the tide that is carrying our society toward final, top-to-bottom "structurization." There are abundant indications that this is in the offing, that the civilization that produced homogenized milk will soon produce the homogenized man.

Not long ago, the Federal Government, acutely concerned over the shortage of scientific and engineering personnel in the United States, launched a program designed to encourage young people to become scientists and engineers.

To date, the technique employed has been one that seeks to

impel young people to choose these careers. Public statements by national leaders and other prominent

187

persons and widespread publicity campaigns aim to make science and engineering attractive, to excite the imaginations of the young and to sell the idea of following such careers to students in high schools and colleges. Huge money grants are financing the expansion of training facilities at universities and colleges and are making it possible for these institutions to offer scholarships and fellowships on an unprecedented scale.
